Package: peptools (via r-universe)

July 11, 2024

Title Analysis Tools for Importing, Wrangling, and Summarizing Suffolk County Water Quality Data

Version 1.1.0

Date 2024-03-05

Description Analysis tools for importing, wrangling, and summarizing Suffolk County water quality data. Functions are used to create reporting materials.

Depends R (>= 3.5)

Imports dataRetrieval, DescTools, dplyr, ggplot2, httr, jsonlite, leaflet, lubridate, mapview, plotly, purrr, reactable, readxl, RColorBrewer, scales, sf, stringr, survival, tidyr

License CC0

Encoding UTF-8

Contents

`anlz_attainpep` *Get attainment categories*

Description

Get attainment categories for each year and bay segment using chlorophyll and secchi depth

Usage

```
anlz_attainpep(meddat, magdurout = FALSE, trgs = NULL)
```

Arguments

`meddat`	result returned from `anlz_medpep`
`magdurout`	logical indicating if the separate magnitude and duration estimates are returned
`trgs`	optional `data.frame` for annual bay segment water quality targets, defaults to `peptargets`

Value

A `data.frame` for each year and bay segment showing the attainment category

Examples

```
meddat <- anlz_medpep(rawdat)
anlz_attainpep(meddat)
```

`anlz_dodlypep` *Analyze daily DO values relative to threshold*

Description

Analyze daily DO values relative to threshold

Usage

```
anlz_dodlypep(dodat, thr = 3, impute = TRUE)
```

Arguments

`dodat`	result returned from `read_pepdo`
`thr`	numeric indicating appropriate dissolved oxygen thresholds, usually 3 mg/L for acute, 4.8 mg/L for chronic
`impute`	logical indicating of missing dissolved oxygen values are imputed with the year, month, site average

Details

The `dodat` data object can be used as input without downloading USGS data

If `impute = TRUE`, missing dissolved oxygen values in the complete daily time series are imputed to the average for the year, month, site combination. This is often necessary to create summary values that make sense. For example, if a month has incomplete data, the maximum `below_cumsum` value will not show 30 or 31 days even if every day in the observed record is below the threshold.

Value

data.frame

Examples

```
data(dodat)
dat <- anlz_dodlypep(dodat)
dat
```

anlz_domopep *Analyze monthly DO values relative to threshold*

Description

Analyze monthly DO values relative to threshold

Usage

```
anlz_domopep(dodat, thr = 3, impute = TRUE)
```

Arguments

dodat	result returned from read_pepdo
thr	numeric indicating appropriate dissolved oxygen thresholds, usually 3 mg/L for acute, 4.8 mg/L for chronic
impute	logical indicating of missing dissolved oxygen values are imputed with the year, month, site average

Details

The dodat data object can be used as input without downloading USGS data

The date are summarized as three different values, where do_mgl is the average of all daily DO averages across the month, below_ave is the proportion of days in a month when concentrations in a given day fell below the threshold (1 would mean all days had an instance of DO below the threshold, 0 would mean none), and below_maxrun is the maximum number of sequential days in a month when concentrations in a given day fell below the threshold (30 or 31, depending on month, would indicate all days in a month had an instance of DO below the threshold).

If impute = TRUE, missing dissolved oxygen values in the complete daily time series are imputed to the average for the year, month, site combination. This is often necessary to create summary values that make sense. For example, if a month has incomplete data, the below_ave summary may indicate a value of one if all daily averages in the available data are below the threshold, whereas the below_maxrun summary may indicate a maximum run of days not equal to the number of days in the month.

Value

data.frame

Examples

```
data(dodat)
dat <- anlz_domopep(dodat)
dat
```

anlz_entpep *Count beach exceedances for enterococcus*

Description

Count beach exceedances for enterococcus

Usage

```
anlz_entpep(entdat, thr = 104)
```

Arguments

entdat	result returned from read_pepent
thr	numeric value defining threshold for exceedance

Details

The exceedance threshold is set by default as 104 cfu/100 ml criterion. This is simply based on counts in a year when any value at any station was above the threshold for each 24 hour period in the record.

The samples column shows how many days of the year were sampled at each beach and the exceedances column shows how many samples were above the threshold.

Value

A data.frame with counts of exceedances per year for each beach

Examples

```
anlz_entpep(entdat)
```

anlz_medpep *Estimate annual medians*

Description

Estimate annual medians by segment for chlorophyll, secchi, and total nitrogen data

Usage

```
anlz_medpep(dat)
```

Arguments

dat	data.frame formatted from read_pepwq

Value

Median estimates for chlorophyll, secchi, and total nitrogen

Examples

```
# view median estimates
anlz_medpep(rawdat)
```

---

beaches *Bathing beaches*

Description

Bathing beaches

Usage

```
beaches
```

Format

A data.frame object

Examples

```
## Not run:

library(sf)
library(dplyr)

beaches <- read.csv('inst/extdata/beaches.csv') %>%
  st_as_sf(
     coords = c('Longitude', 'Latitude'),
     crs = '+proj=longlat +ellps=WGS84 +datum=WGS84 +no_defs'
  )

save(beaches, file = 'data/beaches.RData')

## End(Not run)
```

dodat *Dissolved oxygen data for USGS stations*

Description

Dissolved oxygen data for USGS stations

Usage

```
dodat
```

Format

A `data.frame` object

Examples

```
## Not run:

# 01304562 is Peconic River, 01304200 is Orient Harbor, 01304650 is Shelter Island
dodat <- read_pepdo(site = c('01304562', '01304200', '01304650'),
  nms = c('Peconic River', 'Orient Harbor', 'Shelter Island'))

save(dodat, file = 'data/dodat.RData', compress = 'xz')

## End(Not run)
```

entdat *Raw beach pathogen data from Suffolk County*

Description

Raw beach pathogen data from Suffolk County

Usage

```
entdat
```

Format

A `data.frame` object

Examples

```
## Not run:
library(dplyr)
entdat1 <- read_pepent() %>%
  filter(lubridate::year(Date) < 2022)

entdat2 <- read_pepent(path = '~/Desktop/Enterodata_2023.xlsx') %>%
  filter(lubridate::year(Date) >= 2022)

entdat <- bind_rows(entdat1, entdat2)

save(entdat, file = 'data/entdat.RData', compress = 'xz')

# or the file can be manually downloaded from here (format is not the same as path input from SCM)
# https://gis.suffolkcountyny.gov/portal/home/item.html?id=e3b344ff82b74762b625cacaa3e9621a
entdat <- read.csv('~/Desktop/Beach_Water_Quality_Data.csv', header = T) |>
  dplyr::filter(Type %in% c('Enterococcus', 'Enterococci')) %>%
  dplyr::select(
    Name,
    FieldNum,
    Date = ColDate,
    value = Result,
    status = Character
  ) %>%
  dplyr::mutate(
    status = gsub('[[:digit:]]+|\\.', '', value),
    status = ifelse(status == '', '=', status),
    value = as.numeric(gsub('>|<', '', value)),
    Date = suppressWarnings({dplyr::case_when(
      grepl('\\/', Date) ~ lubridate::mdy(Date),
      grepl("^[[:digit:]]+$", Date) ~ as.Date(as.numeric(Date), origin = "1899-12-30"),
      T ~ NA
    )}),
    Name = dplyr::case_when(
      Name == 'Crescent Beach - Shelter Island' ~ 'Crescent Beach - Suffolk',
      T ~ Name
    )
  ) %>%
  dplyr::filter(Name %in% beaches$Name) |>
  dplyr::arrange(Name, FieldNum, Date)

save(entdat, file = 'data/entdat.RData')

## End(Not run)
```

---

pepseg *Polygon shapefile of segment boundaries*

Description

Polygon shapefile of segment boundaries

Usage

```
pepseg
```

Format

A sf object

Examples

```
## Not run:
library(sf)
library(dplyr)

pepseg <- st_read('~/Desktop/TBEP/Peconic/PEPSegments/PEP_Seg_Reeves.shp') %>%
  st_transform(crs = '+proj=longlat +ellps=WGS84 +datum=WGS84 +no_defs') %>%
  select(bay_segment = NewSegment) %>%
  st_buffer(dist = 0) %>%
  st_crop(xmin = -72.76, xmax = -71.8, ymin = 40.83, ymax = 41.2)

save(pepseg, file = 'data/pepseg.RData', compress = 'xz')

## End(Not run)
```

---

pepstations *Bay stations by segment*

Description

Bay stations by segment

Usage

```
pepstations
```

Format

A data.frame object

Examples

```
## Not run:
library(tidyr)
library(sf)
library(dplyr)
library(readxl)
library(mapedit)
library(mapview)

prj <- 4326
```

```
locs <- read_xlsx('inst/extdata/stationmeta.xlsx') %>%
  select(BayStation = `Station Number`, StationName, Longitude = LON, Latitude = LAT) %>%
  mutate(
    BayStation = as.character(BayStation)
  ) %>%
  sf::st_as_sf(coords = c("Longitude", "Latitude"), crs = prj)

# # use this for spatial selection
# p <- mapview(pepseg) + mapview(locs)
# e1 <- editMap(p)
# locs[e1$finished, ] %>% pull(BayStation) %>% dput

pepstations <- list(
  `1a` = c("60280", "60275", "60270", "60265", "60266", "60260", "60250",
             "60240", "60230", "60210", "60220"),
  `1b` = c("60170", "60101", "60130", "60290", "60148"),
  `2` = c("60102", "60103", "60113", "60104", "60300", "60105", "60106",
             "60107", "60310", "60320", "60114", "60109", "60340", "60121",
             "60124", "60119", "60127", "60126", "60111", "60131", "60118"),
  `3` = c("60122", "60115", "60116", "60330", "60132", "60137", "60133",
             "60134", "60135")
) %>%
  tibble::enframe('bay_segment', 'BayStation') %>%
  unnest(BayStation) %>%
  left_join(locs, ., by = 'BayStation')
crds <- st_coordinates(pepstations)
pepstations <- pepstations %>%
  st_set_geometry(NULL) %>%
  mutate(
    Longitude = crds[, 1],
    Latitude = crds[, 2],
    bay_segment = factor(bay_segment, levels = c('1a', '1b', '2', '3'))
  )

save(pepstations, file = 'data/pepstations.RData', compress = 'xz')

## End(Not run)
```

---

peptargets *Bay segment targets*

Description

Bay segment targets

Usage

```
peptargets
```

Format

A data.frame object

Examples

```
## Not run:
peptargets <- tibble::tibble(
  bay_segment = factor(c('1a', '1b', '2', '3'),
    levels = c('1a', '1b', '2', '3')),
  name = factor(c('1a', '1b', '2', '3'),
    levels = c('1a', '1b', '2', '3')),
  sd_thresh = c(6.5, 6.5, 6.5, 6.5),
  chla_thresh = c(5.5, 5.5, 5.5, 5.5),
  tn_thresh = c(0.4, 0.4, 0.4, 0.4)
)
save(peptargets, file = 'data/peptargets.RData', compress= 'xz')

## End(Not run)
```

---

rawdat *Raw data from Suffolk County*

Description

Raw data from Suffolk County

Usage

```
rawdat
```

Format

A data.frame object

Examples

```
## Not run:
path <- system.file("extdata", "currentdata.xlsx", package="peptools")
rawdat <- read_pepwq(path)
save(rawdat, file = 'data/rawdat.RData', compress = 'xz')

## End(Not run)
```

read_pepdo *Import dissolved oxygen data*

Description

Import dissolved oxygen data

Usage

```
read_pepdo(
  site = c("01304562", "01304200", "01304650"),
  nms = c("Peconic River", "Orient Harbor", "Shelter Island"),
  startDate = "2013-01-01",
  endDate = "2023-12-31"
)
```

Arguments

site	chr string of site numbers for USGS stations
nms	chr string vector of names to reassign to site numbers
startDate	chr string of start date in YYYY-MM-DD
endDate	chr string of end date in YYYY-MM-DD

Details

Raw data are downloaded using the USGS dataRetrieval R package, this function is a simple wrapper to the readNWISuv function.

Note that downloading the station data with the default arguments may take a few minutes. Sites are 01304562 for Peconic River, 01304200 for Orient Harbor, 01304650 for Shelter Island.

Value

data.frame

Examples

```
## Not run:
dodat <- read_pepdo(site = c('01304562', '01304200', '01304650'),
  nms = c('Peconic River', 'Orient Harbor', 'Shelter Island'),
  StartDate = '2020-06-01', endDate = '2021-06-30')
dodat

## End(Not run)
```

read_pepent *Import raw enterococcus data*

Description

Import raw enterococcus data

Usage

```
read_pepent(path = NULL)
```

Arguments

path	chr string of path for excel file (optional)

Details

Data are from the ArcGIS REST Services here https://gis.suffolkcountyny.gov/hosted/rest/services/Hosted/Beach_Water_Quality_Data/FeatureServer/.

The API is queried by beach names in the beaches data object. The queries are done individually for each beach to not exceed the 2000 record limit.

Data can also be imported from an Excel if the path argument is used for the location to the file.

Value

data.frame

Examples

```
## Not run:
entdat <- read_pepent()

## End(Not run)
head(entdat)
```

read_pepwq *Import raw water quality data*

Description

Import raw water quality data

Usage

```
read_pepwq(path)
```

Arguments

path	chr string of path for excel file

Details

Raw data from here https://gis.suffolkcountyny.gov/portal/home/item.html?id=5d4b53ec44204219a8da685f185

All data prior to 1990 are removed - some exist but the data are scarce.

Value

data.frame

Examples

```
path <- system.file("extdata", "currentdata.xlsx", package="peptools")
dat <- read_pepwq(path)
dat
```

---

show_allthrpep *Plot annual water quality value and thresholds for all segments*

Description

Plot annual water quality values and thresholds for all bay segments

Usage

```
show_allthrpep(
  dat,
  param = c("chla", "sd", "tn"),
  trgs = NULL,
  yrrng = NULL,
  family = NA,
  labelexp = TRUE,
  txtlab = TRUE
)
```

Arguments

dat	data frame of data returned by read_pepwq
param	chr string indicating which water quality value and appropriate threshold to plot, one of "chla" for chlorophyll, "sd" for secchi depth, or "tn" for total nitrogen
trgs	optional data.frame for annual bay segment water quality thresholds, defaults to peptargets
yrrng	numeric vector indicating min, max years to include
family	optional chr string indicating font family for text labels

labelexp	logical indicating if y axis and target labels are plotted as expressions, default TRUE
txtlab	logical indicating if a text label for the target value is shown in the plot

Details

This function is conceptually similar to show_thrpep, but results are shown as annual medians across all bay segments for the selected parameter.

Value

A ggplot object

Examples

```
show_allthrpep(rawdat, param = 'chl')
```

---

show_boxpep *Plot monthly chlorophyll, secchi, or tn values values for a segment*

Description

Plot monthly chlorophyl, secchi, or tn values values for a bay segment

Usage

```
show_boxpep(
  dat,
  param = c("chla", "sd", "tn"),
  yrsel = NULL,
  yrrng = NULL,
  ptsz = 0.5,
  bay_segment = c("1a", "1b", "2", "3"),
  trgs = NULL,
  family = NA,
  labelexp = TRUE,
  txtlab = TRUE
)
```

Arguments

dat	data frame of data returned by read_pepwq
param	chr string indicating which water quality value and appropriate threshold to plot, one of "chla" for chlorophyll, "sd" for secchi depth, or "tn" for total nitrogen
yrsel	numeric for year to emphasize, shown as separate red points on the plot
yrrng	numeric vector indicating min, max years to include

ptsz	numeric indicating point size of observations not in yrsel
bay_segment	chr string for the bay segment, one of "1a", "1b", "2", or "3"
trgs	optional data.frame for annual bay segment water quality targets, defaults to peptargets
family	optional chr string indicating font family for text labels
labelexp	logical indicating if y axis and target labels are plotted as expressions, default TRUE
txtlab	logical indicating if a text label for the target value is shown in the plot

Details

Points not included in yrsel are plotted over the box plots using position_jitter. Use ptsz = -1 to suppress.

Value

A ggplot object

Examples

```
show_boxpep(rawdat, bay_segment = '1a')
```

---

show_domatrix *Create a colorized table for reporting dissolved oxygen data by site*

Description

Create a colorized table for reporting dissolved oxygen data by site

Usage

```
show_domatrix(
  dodat,
  site,
  show = c("below_ave", "below_maxrun"),
  txtsz = 3,
  thr = 4.8,
  impute = TRUE,
  yrrng = NULL,
  family = NA
)
```

Arguments

dodat	data frame of dissolved oxygen data returned by read_pepdo
site	character string of the site to plot taken from the nms argument in read_pepdo, usually one of "Peconic River", "Orient Harbor", or "Shelter Island"
show	chr string indicating which summary value to plot from anlz_domopep, one of 'below_ave' or 'below_maxrun'
txtsz	numeric for size of text in the plot, applies only if asreact = FALSE
thr	numeric indicating appropriate dissolved oxygen thresholds, usually 3 mg/L for acute, 4.8 mg/L for chronic
impute	logical indicating of missing dissolved oxygen values are imputed with the year, month, site average
yrrng	numeric vector indicating min, max years to include
family	optional chr string indicating font family for text labels

Value

A static ggplot object is returned.

See Also

anlz_domopep, anlz_dodlypep

Examples

```
show_domatrix(dodat, site = 'Peconic River')
```

---

show_entmatrix *Create a colorized table for beach pathogen exceedances*

Description

Create a colorized table for beach pathogen exceedances

Usage

```
show_entmatrix(entdat, txtsz = 2, thr = 104, yrrng = NULL, family = NA)
```

Arguments

entdat	data frame of enterococcus data returned by read_pepent
txtsz	numeric for size of text in the plot, applies only if asreact = FALSE
thr	numeric value defining threshold for exceedance
yrrng	numeric vector indicating min, max years to include
family	optional chr string indicating font family for text labels

Value

A static ggplot object is returned if asreact = FALSE, otherwise a reactable table is returned

See Also

anlz_entpep

Examples

```
show_entmatrix(entdat)
```

---

show_matrixpep *Create a colorized table for indicator reporting*

Description

Create a colorized table for indicator reporting

Usage

```
show_matrixpep(
  dat,
  txtsz = 3,
  trgs = NULL,
  yrrng = NULL,
  bay_segment = c("1a", "1b", "2", "3"),
  asreact = FALSE,
  nrows = 10,
  abbrev = FALSE,
  family = NA
)
```

Arguments

dat	data frame of water quality data returned by read_pepwq
txtsz	numeric for size of text in the plot, applies only if asreact = FALSE
trgs	optional data.frame for annual bay segment water quality targets, defaults to peptargets
yrrng	numeric vector indicating min, max years to include
bay_segment	chr string for bay segments to include, one to all of "1a", "1b", "2", or "3"
asreact	logical indicating if a reactable object is returned
nrows	if asreact = TRUE, a numeric specifying number of rows in the table
abbrev	logical indicating if text labels in the plot are abbreviated as the first letter
family	optional chr string indicating font family for text labels

Value

A static ggplot object is returned if asreact = FALSE, otherwise a reactable table is returned

Examples

```
show_matrixpep(rawdat)
```

---

show_plotlypep *Plot chlorophyll and secchi data together with matrix outcomes*

Description

Plot chlorophyll and secchi data together with matrix outcomes

Usage

```
show_plotlypep(
  dat,
  bay_segment = c("1a", "1b", "2", "3"),
  yrrng = NULL,
  chllim = NULL,
  seclim = NULL
)
```

Arguments

dat	data.frame formatted from read_pepwq
bay_segment	chr string for the bay segment, one of "1a", "1b", "2", or "3"
yrrng	numeric for year range to plot
chllim	numeric vector of length two indicating range for the chlorophyll y-axis
seclim	numeric vector of length two indicating range for the secchi y-axis

Value

An interactive plotly object

Examples

```
show_plotlypep(rawdat)
```

show_reactablepep *Create reactable table from matrix data*

Description

Create reactable table from matrix data

Usage

```
show_reactablepep(totab, colfun, nrows = 10)
```

Arguments

totab	A data frame in wide format of summarized results
colfun	Function specifying how colors are treated in cell background
nrows	numeric specifying number of rows in the table

Details

This function is used internally within show_matrixpep

Value

A reactable table

show_segmatrixpep *Create a colorized table for water quality outcomes and exceedances by segment*

Description

Create a colorized table for water quality outcomes by segment that includes the management action and chlorophyll, and secchi exceedances

Usage

```
show_segmatrixpep(
  dat,
  txtsz = 3,
  trgs = NULL,
  yrrng = NULL,
  bay_segment = c("1a", "1b", "2", "3"),
  abbrev = FALSE,
  family = NA
)
```

Arguments

dat	data.frame formatted from read_pepwq
txtsz	numeric for size of text in the plot, applies only if tab = FALSE
trgs	optional data.frame for annual bay segment water quality targets, defaults to peptargets
yrrng	numeric vector indicating min, max years to include
bay_segment	chr string for bay segments to include, one to all of "1a", "1b", "2", or "3"
abbrev	logical indicating if text labels in the plot are abbreviated as the first letter, applies only to center column
family	optional chr string indicating font family for text labels

Details

This function provides a combined output for the show_wqmatrixpep and show_matrixpep functions. Only one bay segment can be plotted for each function call.

Value

A static ggplot object is returned

See Also

show_wqmatrixpep, show_matrixpep

Examples

```
show_segmatrixpep(rawdat, bay_segment = '1a')
```

---

show_sitemappep *Map water quality data for a selected year*

Description

Map water quality data for a selected year

Usage

```
show_sitemappep(
  dat,
  yrsel = NULL,
  mosel = NULL,
  param = c("chla", "sd", "tn"),
  bay_segment = c("1a", "1b", "2", "3"),
  maxrel = 0.99,
  relative = FALSE
)
```

Arguments

dat	data frame of data returned by read_pepwq
yrsel	numeric for years to plot, see details
mosel	numeric for months to plot, see details
param	chr string indicating which water quality value to plot, one of "chla" for chlorophyll, "sd" for secchi depth, or "tn" for total nitrogen
bay_segment	chr string for the bay segment, one or all of "1a", "1b", "2", or "3"
maxrel	numeric for the maximum quantile value for scaling if relative = T, this prevents outliers from skewing the scale
relative	logical indicating if sizes and colors are relative to the entire water quality data base, otherwise scaling is relative only for the points on the map

Details

Year estimates for the selected parameter are based on median observations across months. All twelve months are used if mosel = NULL (default). Monthly estimates for the selected parameter are based on median observations across years. All years are used if yrsel = NULL (default).

The color ramp and size scaling of points are reversed for Secchi observations.

Value

A leaflet object

Examples

```
# 2018, all months
show_sitemappep(rawdat, yrsel = 2018)

# 2018, July only
show_sitemappep(rawdat, yrsel = 2018, mosel = 7)

# July only, all years
show_sitemappep(rawdat, mosel = 7)
```

---

show_thrpep *Plot annual water quality value and thresholds for a segment*

Description

Plot annual water quality values and thresholds for a bay segment

Usage

```
show_thrpep(
  dat,
  bay_segment = c("1a", "1b", "2", "3"),
  param = c("chla", "sd", "tn"),
  ylim = NULL,
  trgs = NULL,
  yrrng = NULL,
  family = NA,
  labelexp = TRUE,
  txtlab = TRUE
)
```

Arguments

dat	data frame of data returned by read_pepwq
bay_segment	chr string for the bay segment, one of "1a", "1b", "2", or "3"
param	chr string indicating which water quality value and appropriate threshold to plot, one of "chla" for chlorophyll, "sd" for secchi depth, or "tn" for total nitrogen
ylim	numeric vector of length two indicating range for the y-axis
trgs	optional data.frame for annual bay segment water quality thresholds, defaults to peptargets
yrrng	numeric vector indicating min, max years to include
family	optional chr string indicating font family for text labels
labelexp	logical indicating if y axis and target labels are plotted as expressions, default TRUE
txtlab	logical indicating if a text label for the target value is shown in the plot

Value

A ggplot object

Examples

```
show_thrpep(rawdat, bay_segment = '1a', param = 'chl')
```

---

show_wqmatrixpep *Create a colorized table for chlorophyll or secchi exceedances*

Description

Create a colorized table for chlorophyll or secchi exceedances

Usage

```
show_wqmatrixpep(
  dat,
  param = c("chla", "sd"),
  txtsz = 3,
  trgs = NULL,
  yrrng = NULL,
  alpha = 1,
  bay_segment = c("1a", "1b", "2", "3"),
  asreact = FALSE,
  nrows = 10,
  family = NA
)
```

Arguments

dat	data.frame formatted from read_pepwq
param	chr string for which parameter to plot, one of "chla" for chlorophyll or "sd" for secchi
txtsz	numeric for size of text in the plot, applies only if tab = FALSE
trgs	optional data.frame for annual bay segment water quality targets, defaults to peptargets
yrrng	numeric vector indicating min, max years to include
alpha	numeric indicating color transparency
bay_segment	chr string for bay segments to include, one to all of "1a", "1b", "2", or "3"
asreact	logical indicating if a reactable object is returned
nrows	if asreact = TRUE, a numeric specifying number of rows in the table
family	optional chr string indicating font family for text labels

Value

A static ggplot object is returned if asreact = FALSE, otherwise a reactable table is returned
